- 10. Baggage Domain
- 11. Fuel Domain
- 12. Aircraft Domain
- 13. Schedules Domain
- 14. Onward Flights Domain
- 15. Codeshare Domain
- 16. Resumen de Dominios
- 17. Estrategia de Migración

#### Visión General

Este documento describe la arquitectura de base de datos de FlightHub basada en **Domain-Driven Design** (**DDD**), donde cada dominio de negocio tiene sus propias tablas con responsabilidades claramente definidas.

#### Principios Fundamentales

- 1. Prefijo por Dominio: Todas las tablas llevan prefijo fh\_ seguido del nombre del dominio
- 2. Identificador Único: Cada vuelo tiene un fuid único tipo ULID (26 caracteres)
- 3. Campos de Identificación: Los 6 campos clave se replican en cada tabla de dominio
- 4. Sin JOINs: Cada dominio es independiente y puede consultarse sin JOINs
- 5. Auditoría: Todos los campos llevan created\_at, created\_by, updated\_at, updated\_by

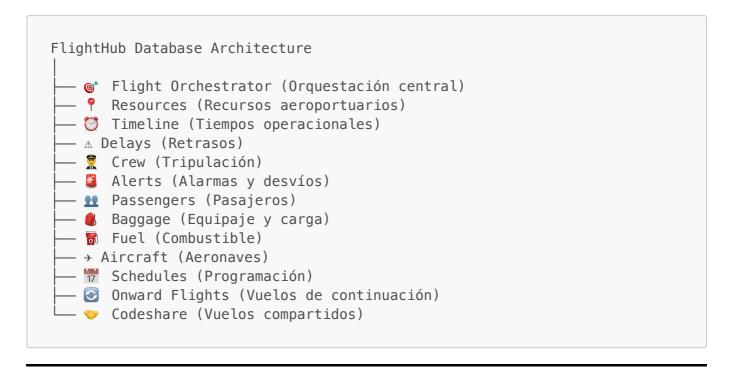

# Los 6 Campos de Identificación

Estos campos aparecen en todas las tablas de todos los dominios:

```
operation_date DATE NOT NULL -- Día de Operación: 2025-
07-01
flight_designator VARCHAR(10) NOT NULL -- Número de vuelo: "999"
operational_suffix VARCHAR(3) NOT NULL -- Sufijo operacional:
"A", "B", ""
airline_designator VARCHAR(3) NOT NULL -- Código IATA: "IB"
```

departure\_airport VARCHAR(3) NOT NULL -- Aeropuerto salida:
"MAD"
departure\_number INTEGER NOT NULL -- Número de intento: 1

#### Dominios del Sistema

# Principios de Diseño

#### 1. Autonomía de Dominios

#### Cada dominio:

- V Tiene sus propias tablas
- V Puede ser consultado independientemente
- V Puede escalar de forma independiente
- V Puede desplegarse independientemente
- V Tiene ownership claro

## 2. Identificación Única

fuid: VARCHAR (26) - ULID (Universally Unique Lexicographically Sortable Identifier)

Ejemplo: "01HQZ8X9Y1K2M3N4P5Q6R7S8T9"

Los 6 campos de identificación externa:

- operation\_date: 2025-07-01
- flight\_designator: "999"
- operational\_suffix: "A" (o "B", "")
- airline\_designator: "IB"
- departure\_airport: "MAD"
- departure\_number: 1

#### 3. Campos Comunes en Todas las Tablas

```
-- Identificación del vuelo (PK o FK)
fuid
                        VARCHAR(26) NOT NULL
-- 6 Campos de Identificación (replicados)
operation date
                        DATE NOT NULL
flight_designator
                       VARCHAR(10) NOT NULL
operational suffix
                       VARCHAR(3) NOT NULL DEFAULT ''
airline designator
                       VARCHAR(3) NOT NULL
departure_airport
                       VARCHAR(3) NOT NULL
departure_number
                        INTEGER NOT NULL DEFAULT 1
-- Auditoría
created at
                        TIMESTAMP NOT NULL
created by
                        VARCHAR NOT NULL
updated at
                       TIMESTAMP NOT NULL
updated_by
                        VARCHAR NOT NULL
```

# Flight Orchestrator Domain

Responsabilidad: Identificación única de vuelos, gestión del ciclo de vida, trazabilidad de mensajes.

Prefijo: fh\_flight
Tabla: fh flight

Descripción: Tabla principal de vuelos con información de identificación única.

```
CREATE TABLE fh_flight (
 -- Identificador único permanente (ULID)
  fuid
                                VARCHAR(26) PRIMARY KEY,
  — 6 Campos de Identificación
  operation_date
                                DATE NOT NULL,
  flight_designator
                                VARCHAR(10) NOT NULL,
                                VARCHAR(3) NOT NULL DEFAULT '',
  operational_suffix
  airline_designator
                                VARCHAR(3) NOT NULL,
  departure_airport
                                VARCHAR(3) NOT NULL,
  departure_number
                                INTEGER NOT NULL DEFAULT 1,
  -- Códigos ICAO adicionales
  airline_designator_icao
                                VARCHAR(4) NOT NULL,
  flight_designator_atc
                                VARCHAR(10) NOT NULL,
  departure_airport_icao
                                VARCHAR(4) NOT NULL,

 INDEX idx flight designator (flight designator),
 INDEX idx_departure (departure_airport),
 INDEX idx_active (active),
 INDEX idx_principal (principal)
);
```

#### Campos clave:

- fuid: Identificador único permanente (ULID 26 caracteres)
- active: Indica si el vuelo está activo (no ha sido modificado por otro)
- principal: Indica si es vuelo principal (no es secundario de otro)
- fuid\_new\_flight: Referencia al nuevo vuelo que desactiva este registro
- fuid\_flight\_principal: Referencia al vuelo principal si este es secundario

);
```

Fuente: dominios.md - fh\_flight\_airport\_resource

**Nota**: Esta tabla consolida todos los recursos aeroportuarios. Si se requiere separar por tipo de recurso en el futuro, se pueden crear tablas individuales:

- fh\_resource\_gate (puertas)
- fh\_resource\_stand (stands)
- fh\_resource\_runway (pistas)
- fh\_resource\_belt (cintas)
- fh\_resource\_counter (mostradores)

## **Timeline Domain**

Responsabilidad: Todos los tiempos operacionales del vuelo (salida, llegada, CDM, embarque, puertas).

Prefijo: fh\_timeline\_

Tabla: fh timeline departure

Descripción: Tiempos de salida del vuelo.

```
CREATE TABLE fh_timeline_departure (
-- Identificador único
id UUID PRIMARY KEY,
fuid VARCHAR(26) NOT NULL REFERENCES
fh_flight(fuid),

```

#### Notas:

- Nombre: fh\_onward\_flight comunica claramente que son vuelos de continuación, no operaciones de turnaround
- **Relación**: Cada registro vincula un vuelo entrante (inbound\_fuid) con un vuelo "siguiente" definido por su código y fecha de operación
- **Extensible**: Se pueden añadir tablas complementarias como fh\_onward\_connection\_log, fh\_mct\_rules o fh\_onward\_status para gestión avanzada
- Índices: Optimizados para buscar rápido por vuelo inbound o por designador + fecha del onward

**Fuente**: dominios.md - fh\_flight\_info (onwardflightdate, onwardairlinedesignator, onwardflightdesignator)

#### Codeshare Domain

# **Event Publisher**

Responsabilidad

El **Event Publisher** es un componente crítico que:

- 1. Recibe eventos de todos los dominios (con FUID + 6 campos)
- 2. Elimina el FUID antes de publicar externamente
- 3. Publica SOLO los 6 campos a EventBridge
- 4. Adapta el payload según el tipo de consumidor

Principio Fundamental: FUID es INTERNO

```
IMPORTANTE: El FUID NO se publica a sistemas externos

Uso INTERNO: FUID + 6 campos (dominios, orchestrator)

Uso EXTERNO: SOLO 6 campos (EventBridge, consumers)
```

## Campos de Identificación Externa

Los 6 campos que se publican a sistemas externos:

#### Flujo de Publicación

```
// 1. Evento INTERNO de dominio (incluye FUID + 6 campos)
const internalEvent = {
  fuid: "01HQZ8X9Y1K2M3N4P5Q6R7S8T9", // ← FUID interno
  operation_date: "2025-01-14",
  flight designator: "347",
  operational suffix: "",
  airline_designator: "IB",
  departure_airport: "MAD",
  departure_number: 1,
  domain: "passengers",
  type: "passengers.checkin.updated",
  data: {
   total_passengers: 180,
    checked_in_passengers: 150,
    boarded_passengers: 0,
  },
  source: "CKI",
  timestamp: "2025-01-14T08:30:00Z",
}:
// 2. Event Publisher recibe el evento
// Los 6 campos YA VIENEN en el evento, NO necesita consultar fh_flight
// 3. Event Publisher ELIMINA el FUID y construye payload externo
const externalEvent = {
  flightIdentifier: {
    operation_date: "2025-01-14",
    flight designator: "347",
    operational_suffix: "",
    airline_designator: "IB",
    departure_airport: "MAD",
    departure_number: 1,
  },
  eventType: "passengers.checkin.updated",
  timestamp: "2025-01-14T08:30:00Z",
  source: "CKI",
  passengers: {
    total: 180,
    checkedIn: 150,
    boarded: 0,
  },
 // ← NOTA: El FUID NO está presente
};
// 4. Publica a EventBridge
await eventBridge.putEvents({
  Entries: [{
    Source: "com.iberia.flighthub",
    DetailType: "passengers.checkin.updated",
    Detail: JSON.stringify(externalEvent),
    EventBusName: "flight-events-bus",
  }],
});
```

### Implementación del Event Publisher

```
class EventPublisher {
  async publishDomainEvent(domainEvent: DomainEvent) {
   // 1. Los 6 campos ya vienen en el evento de dominio
   // NO necesita consultar fh flight
   // 2. Construir identificador externo (SIN FUID)
   const externalId: ExternalFlightIdentifier = {
      operation_date: domainEvent.operation_date,
      flight designator: domainEvent.flight designator,
      operational_suffix: domainEvent.operational_suffix || "",
      airline_designator: domainEvent.airline_designator,
      departure_airport: domainEvent.departure_airport,
      departure number: domainEvent.departure number,
   };
   // 3. Construir payload según el tipo de cambio
   const payload = this.buildPayload(domainEvent, externalId);
   // 4. Publicar a EventBridge
   await eventBridge.putEvents({
      Entries: [{
        Source: "com.iberia.flighthub",
        DetailType: domainEvent.type,
        Detail: JSON.stringify(payload),
        EventBusName: "flight-events-bus",
        Resources: [
`flight:${externalId.airline_designator}:${externalId.flight_designator}`,
          `airport:${externalId.departure_airport}`,
          `date:${externalId.operation_date}`,
       ],
      }],
   });
  }
  private buildPayload(
   event: DomainEvent,
   externalId: ExternalFlightIdentifier
   // Payload base con identificadores externos (SIN FUID)
   const basePayload = {
      flightIdentifier: externalId, // ← Solo 6 campos
     timestamp: event.timestamp,
      source: event.source,
     eventType: event.type,
   };
   // Agregar datos específicos del dominio
   switch (event.domain) {
```

```
case "passengers":
        return {
          ...basePayload,
          passengers: {
            total: event.data.total passengers,
            checkedIn: event.data.checked in passengers,
            boarded: event.data.boarded_passengers,
          },
        };
      case "fuel":
        return {
          ...basePayload,
          fuel: {
            uplift: event.data.fuel uplift,
            planned: event.data.fuel_planned,
            remaining: event.data.fuel_remaining,
          },
        };
      case "timeline":
        return {
          ...basePayload,
          times: {
            scheduledDeparture: event.data.departure_time_scheduled,
            estimatedDeparture: event.data.departure_time_estimated,
            actualDeparture: event.data.departure_time_actual,
          },
        };
      // ... otros dominios
    }
 }
}
```

#### Beneficios del Modelo Dual

- 1. **V** FUID interno: Simplicidad, inmutabilidad, performance (solo uso interno)
- 2. **G campos externos**: Compatibilidad con estándares aeronáuticos
- 3. **Trazabilidad**: departure\_number mantiene relación entre intentos de despegue
- 4. V No consultas adicionales: Los 6 campos ya vienen en cada evento de dominio
- 5. Separación de concerns: Dominios trabajan con FUID + 6 campos, externos solo 6 campos
- 6. Sin FUID en EventBridge: Los sistemas externos no necesitan conocer el FUID interno

## Manejo de Turnarounds

Cuando un vuelo despega múltiples veces (return, diversion):

```
// Primer despegue
{
  fuid: "01HQZ8X9Y1K2M3N4P5Q6R7S8T9",
```

```
operation_date: "2025-01-14",
  flight_designator: "347",
  airline_designator: "IB",
  departure_airport: "MAD",
 departure_number: 1, // Primer intento
}
// Segundo despegue (return to base)
 fuid: "01HQZ8X9Y1K2M3N4P5Q6R7S8T9", // Mismo FUID
  operation_date: "2025-01-14",
 flight_designator: "347",
  airline_designator: "IB",
  departure_airport: "MAD",
 departure_number: 2, // Segundo intento
// Evento externo publicado (incluye departure number)
  flightIdentifier: {
    operation_date: "2025-01-14",
    flight_designator: "347",
    operational_suffix: "",
    airline_designator: "IB",
   departure_airport: "MAD",
   departure_number: 2, // ← Identifica el intento
  eventType: "flight.departed",
  // ... datos del vuelo
```

# Resumen de Dominios

Tabla Resumen de Dominios y Tablas

| Dominio             | Prefijo      | Tablas | Responsabilidad Principal                                   |
|---------------------|--------------|--------|---|
| Flight Orchestrator | fh_flight    | 3      | ldentificación única, control de ciclo de vida,<br>mensajes |
| <b>↑</b> Resources  | fh_resource_ | 1      | Recursos aeroportuarios (gates, stands, runways, belts)     |
| <b>♡</b> Timeline   | fh_timeline_ | 4      | Tiempos operacionales (departure, arrival, CDM, checkin)    |
| <b>⚠</b> Delays     | fh_delay_    | 1-2    | Retrasos y códigos de delay                                 |
| Crew                | fh_crew_     | 1      | Tripulación técnica y de cabina                             |
| Alerts              | fh_alert_    | 2      | Alarmas y desvíos   |

| Dominio             | Prefijo       | Tablas | Responsabilidad Principal     |
|---------------------|---------------|--------|-------------------------------|
| <b>№</b> Passengers | fh_pax_       | 3      | Pasajeros, capacidad, cabinas |
| Baggage             | fh_bag_       | 3      | Equipaje, carga, correo       |
| <b>≅</b> Fuel       | fh_fuel_      | 4      | Combustible y repostaje       |
| → Aircraft          | fh_aircraft_  | 2      | Aeronaves y configuraciones   |
| T Schedules         | fh_schedule_  | 1      | Programación y servicio       |
| Onward Flights      | fh_onward_    | 1      | Vuelos de continuación        |
| Codeshare           | fh_codeshare_ | 1      | Vuelos compartidos            |

#### Conteo Total de Tablas

```
P Resources:
                    1 tabla
Timeline:
                   4 tablas
△ Delays:
                   1 tabla (+ 1 opcional normalizada)
Crew:
                   1 tabla
🚨 Alerts:
                    2 tablas
Passengers:
                    3 tablas
Baggage:
                    3 tablas
                    4 tablas

    Fuel:

→ Aircraft:
                   2 tablas
77 Schedules:
                    1 tabla
Onward Flights:
                    1 tabla
Codeshare:
                    1 tabla
TOTAL:
                   27 tablas
```

## Comparación: Antes vs Después

#### **ANTES (Sistema Legacy):**

- X 20 tablas flight\_\* mezclando responsabilidades
- X flight\_departure\_info con 100+ campos mezclados
- X Queries complejas con múltiples JOINs
- X Difícil de escalar y mantener

## **DESPUÉS (Arquitectura por Dominios):**

- **2**7 tablas organizadas en 13 dominios
- V Cada tabla tiene responsabilidad clara
- Queries sin JOINs (6 campos replicados)
- V Escalabilidad independiente por dominio
- **V** Ownership claro
- Prefijos consistentes (fh\_\*)

# Estrategia de Migración

## Fase 1: Preparación

- 1. Crear nuevas tablas con prefijo fh\_\* en paralelo a las existentes
- 2. Mapear campos de tablas legacy a nuevos dominios
- 3. Implementar lógica de dual-write en aplicación

#### Fase 2: Dual Write

#### Fase 3: Migración de Datos Históricos

- 1. Script de migración para copiar datos existentes a nuevas tablas
- 2. Validación de integridad de datos
- 3. Verificación de consistencia entre ambas estructuras

#### Fase 4: Cambio de Lectura

```
// Leer de nueva estructura, seguir escribiendo en ambas
async function getFlightTimeline(fuid: string): Promise<TimelineData> {
   // Leer de nueva estructura
   return await timelineRepo.getDepartureTimeline(fuid);
}
```

#### Fase 5: Solo Nueva Estructura

```
// Solo usar nueva estructura
async function updateFlightTimeline(fuid: string, data: TimelineData) {
```

```
return await timelineRepo.updateDepartureTimeline(fuid, data);
}
```

## Fase 6: Deprecación Legacy

- 1. Remover código de dual-write
- 2. Archivar tablas legacy
- 3. Documentar cambios

# Beneficios de la Nueva Arquitectura

1. Separación Clara de Responsabilidades

```
X ANTES:
flight_departure_info (100+ campos mezclados)

─ Times (20+ campos)

├─ Gates/Stands (10+ campos)
Passengers (30+ campos)
Check-in (10+ campos)
 - Crew (15+ campos)
└─ Baggage (10+ campos)
✓ DESPUÉS:
Timeline Domain

⊢ fh timeline departure (31 campos)

├ fh_timeline_arrival (28 campos)
 - fh_timeline_cdm (45 campos)
└ fh_timeline_checkin (3 campos)

    Resources Domain

└ fh_resource_airport (25 campos)

    Passengers Domain

— fh_pax_summary (18 campos)
Crew Domain
└ fh_crew_assignment (6 campos)
Baggage Domain
```

#### 2. Queries Optimizadas Sin JOINs

```
-- X ANTES: Múltiples JOINs
SELECT
f.*,
```

```
fi.*,
  fdi.*,
  fai.*
FROM flights f
LEFT JOIN flight info fi ON f.flight info id = fi.id
LEFT JOIN flight departure info fdi ON f.flight departure info id = fdi.id
LEFT JOIN flight_arrival_info fai ON f.flight_arrival_info_id = fai.id
WHERE f.flight id = '20250701 IB 999 b MAD 1';
-- ▼ DESPUÉS: Query directa sin JOINs
SELECT * FROM fh_timeline_departure
WHERE fuid = '01HQZ8X9Y1K2M3N4P5Q6R7S8T9';
-- O bien usando los 6 campos de identificación:
SELECT * FROM fh timeline departure
WHERE operation_date = '2025-07-01'
 AND airline_designator = 'IB'
  AND flight designator = '999'
 AND operational suffix = 'B'
  AND departure_airport = 'MAD'
  AND departure_number = 1;
```

#### 3. Escalabilidad Independiente

- 🔽 Timeline Domain puede tener más réplicas durante horas pico
- V Passengers Domain escala independientemente durante check-in
- V Fuel Domain escala según necesidad de repostaje

#### 4. Deploys Independientes

- Cambios en Fuel Domain no afectan Timeline Domain
- Menos riesgo en despliegues
- Rollbacks por dominio

#### 5. Ownership Claro

- Cada equipo es dueño de su dominio
- Responsabilidades claras
- V Autonomía de equipos

# Conclusión

Esta arquitectura de base de datos por dominios transforma el sistema monolítico legacy en una arquitectura moderna, escalable y mantenible basada en Domain-Driven Design (DDD).

#### Logros Principales

- 1. **13 dominios independientes** con responsabilidades claras
- 2. **27 tablas organizadas** con prefijos consistentes fh\_\*
- 3. Sin JOINs necesarios gracias a los 6 campos replicados

- 4. **Secalabilidad por dominio** según carga específica
- 5. Separación de concerns clara y lógica
- 6. **Facilita microservicios** futuros por dominio
- 7. **Ownership claro** para equipos

#### Próximos Pasos

- 1. Revisar y validar estructura de dominios
- 2. Implementar scripts de migración
- 3. Establecer estrategia de dual-write
- 4. Definir ownership por dominio
- 5. Crear documentación técnica detallada
- 6. Planificar rollout gradual

Documento generado: 2025-01-XX Versión: 2.0 Basado en: dominios.md + old.md
